

RENKU CHEATSHEET

GETTING STARTED

\$ pip install renku

Install with pip

\$ renku init my-renku-project \$ cd my-renku-project

Starting a Renku project.

DATASETS

\$ renku dataset create <dataset>

Create a new dataset.

\$ renku dataset ls

List all datasets in the project.

\$ renku dataset rm <dataset>

Remove a dataset.

\$ renku dataset add <dataset> <url>

Add data from <url> to a dataset. <url> can be a local file path, an http(s) address or a Git git+http or git+ssh repository.

\$ renku dataset add <dataset> --source <path> [--destination <rel-path>] <git-url>

Add only data in <path> from Git. With -destination: location the data is copied to.

\$ renku dataset update <dataset>

Update files in a dataset based on their source.

\$ renku dataset tag <dataset> <tag> [-d <desc>]

Add a tag to the current version of the dataset, with description <desc>.

\$ renku dataset ls-tags <dataset>

List all tags for a dataset.

\$ renku dataset rm-tags <dataset> <tags...>

Remove tags from a dataset.

\$ renku dataset import <uri>>

Import a dataset. <uri> can be a Renku, Zenodo or Dataverse URL or DOI.

\$ renku dataset export <dataset> <pre

Dataverse.

\$ renku dataset ls-files

List all dataset files in project.

\$ renku dataset unlink <dataset> [--include <path|pattern>]

Remove files from a dataset.

RUNNING

\$ renku rerun <path>

Recreate the file(s) <path> by rerunning the commands that created them.

\$ renku run --name <name> <command> [--input <in_file>...] [--output <out_file>...]

Execute a <command> with Renku tracking inputs and outputs. Input and output files are automatically detected from the command string. Creates a workflow template named <name>. With -input and/or -output: Manually specify input or output files to track.

\$ renku run --name <name> <command> --no-output

Run a <command> that produces no output.

\$ renku status

The the status of generated output files in the project.

\$ renku update [--all] [<path>...]

Update outdated output files created by renku run. With <path>'s: Only recreate these files. With –all: Update all outdated output files.

Workflows

\$ renku workflow ls

List Plans (workflow templates).

\$ renku workflow show <name>

Show details for Plan < name>.

\$ renku workflow execute --provider provider> [--set <param-name>=<value>...] <name>

Execute a Plan using provider> as a backend, overriding parameter <param-name>'s value.

\$ renku workflow iterate [--map <param-name>=[value,value,...]] <name>

Repeatedly execute a Plan, taking values from the list specified with -map.

RENKU CHEATSHEET

\$ renku workflow export --format <format> <plan>

Export a Plan in a given format (e.g. 'cwl').

\$ renku workflow compose <composed-name> <plan>

Create a new Plan composed of child Plans.

\$ renku workflow edit <plan>

Create a new Plan composed of child Plans.

\$ renku workflow delete <plan>

Remove a Plan.

\$ renku workflow visualize [--interactive]

Show linked workflows as a graph.

\$ renku workflow revert <activity ID>

Undo a Run.

\$ renku workflow inputs

\$ renku workflow outputs

Show input respectively output files used by workflows.

CONFIG

\$ renku config show [<key>]

Show current configuration.

\$ renku config set <key> <value>

Set entry <key> to <value> in renku config.

\$ renku config remove <key>

Unset entry <key> renku config.

\$ renku doctor

Check your system and repository for potential problems.

\$ renku gc

Free up disk space used for caches and temporary files.

\$ renku log

Show a history of renku actions.

\$ renku migrate

Migrate old metadata to the current Renku version.

\$ renku mv <path>... <destination>

Safely move files within a project.

\$ renku rm <path>...

Safely delete files from a project.

\$ renku save [-m <message>]

Save (commit) and push all local changes. with optional message.

\$ renku storage pull <path>...

Pull <path>'s from external storage (LFS).

CONFIGURATION OPTIONS

registry: Docker image registry

zenodo.access_token: Token for Zenodo export

dataverse.access_token: Token for Dataverse export

show_lfs_message: Whether to show the LFS warning message

Ifs_threshold: Size threshold below which files aren't added to LFS
